Summit Roof Semi-Gloss CoolColour™

Resene Summit Roof Semi-Gloss CoolColour™ is a unique waterborne acrylic paint for use in application and maximum durability. This modern product provides excellent adhesion to a variety of surfaces, including metal, masonry, and prepared cementitious surfaces. A Resene CoolColour was developed specifically to address consumer requests for a durable, water-based coating that will improve the energy performance of outdoor surfaces. It is recommended for use on galvanized steel, Zincalume, or galvanised sheet metal – or on any metal surface that is prime coated by the installer. In addition, this product provides excellent blocking of sun rays, making the painted surface cool to touch. Check with Resene before applying to zinc or galvanized steel to ensure it will not react with the metal and cause discoloration or corrosion in the future. The product may also be used to paint a wide variety of surfaces, including metal, masonry, and prepared cementitious surfaces (or similar) and salt.

Application method

Application of a Resene CoolColour will reflect more heat compared to standard or non-cool finishes. A Resene CoolColour uses sophisticated pigment technology to reflect more of the sun’s energy than a standard finish or similar. Use the chart below to demonstrate the difference between a standard finish and a Resene CoolColour finish on a roof or wall surface. The energy reflected is calculated from the hemispherical view of the sun’s energy using the combined reflectivity of the surface and reflected surface.
